-----

DC V2L extracts power through the vehicle's DC charging interface, then converts DC to AC using an external inverter to supply power to electrical devices. The discharge power typically ...

These vehicles require specialised DC V2L discharge inverters for external power supply. DC V2L draws power from the vehicle's DC charging port, then converts the direct current to ...

Embodiments of the present disclosure enable the rapid discharging of a DC link capacitor of a traction inverter in the event that such discharge is called for.

The proposed solution has a higher discharge rate and reduces the voltage overshoot on the DC-Link capacitor. The proposed hardware is verified using the simulation and experiments conducted on a ...

Explore the live demonstration of the GD3162's DC Link discharge feature and discover how NXP is enabling smarter, safer and more efficient EV systems through its latest portfolio of high ...

This specialized product is designed to extract DC power directly from Tesla's fast-charging port and then convert it into safe, usable AC power using a built-in high-performance inverter.

Core Function: Outputs high-voltage DC power through the vehicle's DC charging port to power dedicated DC loads such as high-voltage tools and energy storage devices.

The DC-Link capacitor is a part of every traction inverter and is positioned in parallel with the high-voltage battery and the power stage (see Figure 1). The DC-Link capacitor has several functions, ...

This reference design demonstrates control of the HEV or EV traction inverter and bidirectional DC-DC converter with a single TMS320F28388D real-time C2000 MCU.

It is designed to safely and efficiently convert the DC power stored in the battery to AC power, which can then

# DC external discharge inverter

be used for various applications, such as charging other electric vehicles, ...
