The air inlet must be capable of moving enough air through the room to provide the correct minimum CFM (cubic feet per minute) cooling for generator as specified by the generator's manufacturer.

You don't need to push any air in, but you DO need to flow the air from the panel end to the exhaust end, where it can also remove all the exhaust painlessly along with the cooling air.

It is important to note that cooling air is needed for more than just the engine; the generator intake also requires cool clean air. The most effective way to do this is to provide a ...

Generators produce heat and fumes when running. Good airflow removes hot air and exhaust quickly. This prevents heat build-up that can damage the generator. Fresh air intake is also vital. It supplies ...
