Do microgrids participate in frequency regulation markets operated by the RTO?

Here, we focus on (i) participation of microgrids in frequency regulation markets operated by the RTO through the identification of appropriate bids and (ii) the coordination among RTO and aggregators to efficiently dis-aggregate the regulation signal amongst the aggregators.

How can microgrids participate in the market clearance stage?

We have developed meaningful abstractions for the capacity, cost of generation, and ramp rates by taking into account the power flow equations inside the microgrid. This provides enough information for the microgrids to participate in the market clearance stage.

How does a frequency regulation market work?

The frequency regulation market is operated by an RTO to regulate the system frequency at its nominal value. To achieve this, the RTO coordinates the response of participating energy resources in a centralized fashion to assign the regulation signal and restore the power balance of the grid.

Is there a market scheduling and pricing method for comprehensive frequency regulation services?

In this paper, a market scheduling and pricing method for comprehensive frequency regulation services (FRSs) is proposed. First, a modeling approach for flexible FR capabilities of WPGs is proposed based on the mechanism of inertia control and power reserve control.
