This paper provides a multi-stage methodology for solving the energy management optimization (EMO) problem of MG under uncertainty considering carbon trading market and demand ...

This paper presents a novel Robotic Process Automation (RPA)-driven energy management framework that optimizes microgrid operations under uncertainty, with a focus on demand-side control.

Effective demand response (DR) strategies are crucial for maintaining system stability and economic efficiency, particularly in microgrids with high renewable penetration.

The presented work integrates demand response (DR) programs into the operational framework of microgrids to address these challenges. The first phase of the proposed work estimates ...

Abstract: An effective modeling and optimization method, which takes into account source-load-storage coordination, and full-time collaborative optimization within and outside micro-grids, is introduced.

This study highlights the importance of dynamic demand response strategies and grid participation for sustainable and cost-effective microgrid management.
