What happens if a microgrid goes out?

In the event of an outage, microgrids can provide power to a specific building like a fire station for an extended period. Multiple buildings and facilities can also be interconnected into a single microgrid called an "area microgrid" so when power in that area goes out, grid operators switch power over to the microgrid to keep the lights on.

Can microgrids restore power in a power outage?

Microgrids can take advantage of local renewable energy sources to restore power in outages, such as these solar panels at the University of California, Santa Cruz. This article is part of our exclusive IEEE Journal Watch series in partnership with IEEE Xplore.

Why are independent microgrid power systems on the rise?

Independent microgrid power systems are on the rise as demand from large users soars and new technologies offer wider benefits to customers. November 3 - Microgrids are being developed across the U.S. as new data centers drive up power demand and companies and communities seek reliable power supplies and protection against extreme weather outages.

Can microgrids provide power to rural areas?

Microgrids can also supply power to customers in rural areas not able to connect directly to the central grid. More than 400 microgrids will be deployed through GRIP projects, all leading to more resilient and reliable power for neighborhoods and communities. Here are a few examples.
