This study designed a full-scale physical fire test platform for lithium iron phosphate prefabricated cabin energy storage systems, analyzing temperature, voltage, CO, and VOC ...

To minimize the range penalty associated with EV cabin heating, a novel climate control system that includes thermal energy storage from an advanced phase change material (PCM) has been ...

The potential of a modular designed thermochemical adsorption heat storage system to meet temperature, power, and response time requirements for EV cabin heating has been explored.

According to the invention, a single phase change heat exchange mechanism can be used for cooling and heating the battery box of the whole prefabricated cabin, and the power consumption component...

To minimize the range penalty associated with EV cabin heating, a novel climate control system that includes thermal energy storage has been designed for use in EVs and plug-in hybrid electric ...

Through simulation tests, the control effects of the system were compared under various cabin temperature control strategies and ventilation control strategies. The results unequivocally ...

Therefore, the working and storage conditions of various systems inside the energy router are also more stringent. In view of this, this article studies the thermal characteristics of polar energy routers and ...

Temperature variations in the battery and passenger cabin are compared at ambient temperatures of 30° and 40° using the SP-NMPC and prototype original control strategy. The ...

To improve EV energy efficiency, this paper proposes an effective model predictive control (MPC)-based energy management strategy to simultaneously control the battery thermal ...
